

## Our manifesto

The global demand for energy is booming – it's set to bump up nearly 30 percent by 2040. We're at a crossroads.

Wasting energy is simply no longer an option.

Nearly three-quarters of all the energy produced by humanity is squandered as waste heat. Waste heat is a problem of a thousand cuts, requiring many different innovations. Heat capture is one of these solutions.

Some say that recapturing excess heat could power most of Europe. And while much is being done, engineers have struggled to resolve heat capture in some of our most punishing environments. Commercial kitchens and laundries, heavy industry sites and others are pumping hot, greasy, polluted air into the atmosphere. - What a waste!

Most experts have thought it impossible to extract clean heat energy from these polluted airstreams. And they were right. Until now.

For more than 20 years, Our founders have been singularly focused on resolving this engineering – and environmental – challenge. The solution to the problem was the product of a lot of hard work – and a little unexpected inspiration. And our innovation is game-changing.

It's all right there in this metal box.

And what it does is nothing short of miraculous. Finally, polluted heat exhaust can be recycled into heat energy.

*We're turning waste into watts.*

Enjoy is helping its customers save money, conserve energy, and shrink mankind's climate footprint. Inaction is no longer an option. Yes, we're making history. And we're just getting started. Enjoy is ready to take on the world.

We believe that the growth of our company is vital to addressing one small but significant part of the global climate challenge. And while we recognize that growth isn't always great for the environment, we're comfortable with that contradiction. Our business means business.

The reality as we see it is this. We are living at the leading edge of the climate crisis. This presents an existential threat to humanity. And it's one of our own creation. We want to do our part – and inspire others to join us. To make a commitment that extends beyond a baseline commercial impulse. To take accountability. To make a difference.

Some say circularity is a lot of hot air.

We couldn't agree more.
